iSectors<sup>®</sup> Post-MPT Growth Allocation declined 4.43% (including fees) during the 2nd quarter of 2010, which was good performance relative to the S&P 500 benchmark, which declined by 11.43% over the same period. Post-MPT Growth currently shows favorable performance comparisons relative to the S&P 500 index for the one, three and five year periods ending 6/30/2010. The positive results for the 2nd quarter, relative to the benchmark, were generated primarily because of a change from a fairly aggressive allocation that included energy, financials and technology early in the quarter, to a more defensive position of mostly bonds, utilities and gold later in the quarter.

iSectors Post-MPT Growth offers a new and innovative approach to optimizing your core portfolio's allocation in an environment where traditional approaches may no longer be working. Although past results are no guarantee of future returns, this strategy over its history has outperformed the S&P 500 with less risk. iSectors Post-MPT Growth has historically outperformed hedge fund indexes as well, but with lower cost, complete transparency with respect to holdings, and daily liquidity. The model is available to anyone with a \$50,000 minimum investment.

**The objective of iSectors Post-MPT Growth Allocation** is to achieve investment returns that outperform the S&P 500 stock market index with lower downside risk over a complete market cycle. The investment model optimizes the portfolio among up to nine specific, low-correlated asset classes. The mathematical process of determining the optimal asset allocation includes over a dozen economic and capital market factors. Portfolios may be invested up to a maximum of 30% into any one asset class. However, up to 50% of the allocation may be invested in government bonds. iSectors Post-MPT Growth Allocation may utilize leveraged ETFs to achieve up to 33% portfolio leverage. Because the allocation does not use borrowed money in its strategy, it is available for retirement and non-profit accounts. Client accounts are separately managed and offer daily liquidity. Securities holdings, performance and tax information, with prices updated as of the previous day's close, can be viewed online. For more information, visit [www.iSectors.com](http://www.iSectors.com).

**IMPORTANT:** Performance results for years highlighted in gold were determined by the retroactive application of the asset allocation model prior to Feb. 1, 2005. Performance results beginning Feb. 1, 2005 represent actual returns.

Latest Returns	Model	S&P500	60/40**
Last Quarter	(4.43)%	(11.43)%	(5.58)%

**IMPORTANT DISCLOSURE INFORMATION**

iSectors<sup>®</sup> is a series of proprietary asset allocation models and services. iSectors, LLC is an affiliate of Sumnicht & Associates, LLC (Sumnicht) and, as such, iSectors and Sumnicht share certain employees' services. iSectors became registered as an investment advisor in August 2008. iSectors allocation models are only available through registered investment advisors. iSectors<sup>®</sup> is a registered trademark of Sumnicht Holdings, LLC.

The contents of this presentation are for informational purposes only. This is neither an offer nor a solicitation to buy and/or sell securities. Information pertaining to iSectors' advisory operations, services, and fees is set forth in its current disclosure statements (Form ADV Part II and Schedule F), a copy of which is available upon request.

iSectors' allocation models are not guaranteed and involve risk of loss. At any given point in time, the value of iSectors allocation model portfolios may be worth more or less than the amount invested. Different types of investments and/or investment strategies involve varying levels of risk, and there can be no assurance that any specific investment or investment strategy (including the investments and/or investment strategies devised or undertaken by iSectors) will be either suitable or profitable for a client's or prospective client's portfolio.

Past performance may not be indicative of future results. Therefore, no current or prospective client should assume that future performance will be profitable, or equal either the performance results reflected or any corresponding historical index. Asset allocation and diversification concepts do not ensure a profit nor protect against loss in a declining market.

The historical index performance results are provided exclusively for comparison purposes only, so as to provide general comparative information to assist an individual client or prospective client in determining whether the performance of a specific investment meets, or continues to meet, investment objective(s). It should not be assumed that any account holdings will correspond directly to any comparative index. Index results do not take into account the impact of taxes. Indexes are not available for direct investment. Index performance results are compiled directly by each respective index and/or obtained by iSectors from other reliable sources, and have not been independently verified by iSectors.

Performance results for the iSectors model(s) presented herein for the corresponding time periods noted reflect hypothetical (pro forma), back-tested results that were achieved by means of the retroactive application of a back-tested model and, as such, the corresponding results have inherent limitations, including: variances in account holdings, market fluctuation, the date on which a client engaged iSectors services, regular model rebalancing and/or updates, and/or the timing of account contributions and withdrawals, as well as the following:

- (1) Model results do not reflect the results of actual trading using client assets, but were achieved by means of the retroactive application of each of the above-referenced model(s).
- (2) Back-tested performance may not reflect the impact that any material market or economic factors might have had on the advisor's use of the model(s) if the model had been used during the period to actually manage client assets; and,
- (3) For various reasons (including the reasons indicated above), iSectors clients may have experienced investment results during the corresponding pro-forma time periods that were materially different from those portrayed in the model.

Hypothetical (pro forma) and actual composite performance results reflect the reinvestment of dividends and other account earnings and do not reflect the impact of taxes. Performance results have been reduced by the maximum iSectors fee, along with estimated costs of transaction, custodial, platform and investment management fees of 0.60, based upon accounts equal to or greater than the recommended minimum \$100,000 investment on platforms charging .15% and using custodians that also charge a 0.15% annual fee for transactions.

For reasons including platform provider and custodian utilized, as well as variances in portfolio account holdings, market fluctuation, the date on which a client engaged iSectors' services, regular model rebalancing and/or updates, and timing of account contributions and withdrawals, the underlying fees of a specific client's account may vary from these estimates. ERISA (group retirement) accounts may be subject to additional recordkeeping and/or administrative fees. iSectors investment allocation models are only available through registered investment advisors, who will charge an additional fee for their advisory services. For information about the fees that pertain to your account, check with your advisor.

You should not assume that any discussion or information contained in this presentation serves as the receipt of, or as a substitute for, personalized investment advice from an investment professional.

This presentation has not been reviewed, submitted for review before, or otherwise approved by FINRA, the SEC or any state or provincial securities administrator.

Definitions: Sharpe ratio measures risk-adjusted return, calculated by taking an asset's excess returns (return in excess of the return generated by a risk-free asset, such as Treasury bills), divided by the asset's standard deviation, or level of volatility. Sortino ratio is a measure of risk-adjusted return. It is a modification of the Sharpe ratio, but penalizes only those returns falling below a user-specified target, or required rate of return. It is calculated by subtracting the risk-free rate from the return of the portfolio and then dividing by the downside deviation.
